

Passion Project Planning - Cocktail Recipe App

Summary:

I am creating an app where users can find recipes for custom cocktails that have been created by several different bartenders. The database of my app will compromise of two tables, one to store the cocktails and one to store the bartenders. The tables will have a one to many relationship as one bartender can post many cocktails but each cocktail was only created by one bartender. In addition to full CRUD functionality I would also like to add a search function where the user can enter which ingredients they have and will be presented with the options for drinks they can make.

ERD:

Storyboard/User Narrative:

The user arrives at home after spending a long Friday at work, and they decide to make themselves a drink. They take stock of what liquors and mixes they have on hand and open the cocktail recipe app. They enter their ingredients into the search bar and see several links to drinks they can make. They click on the link to a Blue Hawaiian recipe where they can see the name of the drink, the ingredients, the name of the bartender who created the drink, and the category that the drink belongs to (in this case Tropical). The user follows the recipe and settles down for the evening to enjoy their drink.
